WHY WE STILL NEED TO WEAR A MASK AFTER THE COVID VACCINE?

More than 24 million doses of the COVID vaccine have been administered across 41 countries, whilst global numbers of cases are still on the rise.

With the new strain carrying a higher transmission percentage, it has become apparent not only to us but to many others, that the only way to stop a pandemic is to utilize all the tools available.

One of which is the variations of COVID vaccines.

But the question on everyone's tongue is; **will this vaccine make me immune?**

According to Michael Tal, an immunologist at Stanford University, many people believe that once they are vaccinated, they no longer need to wear masks due to being immune. This, is actually incorrect, as Tal continues to state that;

"It's really going to be critical for them to know they have to keep wearing masks because they could still be contagious."

With the new vaccines rolling out, we have to have a solid understanding that it's rare for any vaccine to have 100% efficacy.

WHAT DOES THIS REALLY MEAN?

In early November Pfizer shared that its two-dose vaccine was more than 90% effective in keeping 43,538 people in phase 3 clinical trials safe from COVID-19 infection. Along with Moderna's clinical trial where the company's vaccine was 94.5% effective at preventing COVID-19 infection in those who received two doses, with more than 30,000 people in the U.S. enrolled in the trial.

HOW YOU MAY ASK?

With most respiratory infections, including COVID-19, the nose is the main port of entry, this being where the virus will rapidly multiply, and take hold throughout the body in various ways and symptoms.

When we build antibodies to a virus and encounter the same virus for the second time, our bodies understand how to fight it off before it takes effect, similar to when we are vaccinated. But what we don't realize is that the virus, that has entered the nostrils and mucosa, will leave the body immediately.

There is still a large risk that we can transmit through sneezing, coughing or breathing out, when around other people.

Overall, our PRO masks filter out nearly 100 percent of pollution and gases, [99.6 percent of viruses, and 99.77 percent of bacteria](#), leaving the wearer with clean, purified air. It is also designed to be breathable, comfortable, and adjustable in order to provide a pleasant wearing experience.

This mask is the perfect investment for travelers, cyclists, urban residents, people with respiratory diseases, and anyone who wants to protect against smoke, pathogens, and air pollution. Our PRO mask is washable and approved for about 340 hours of use—roughly six months of daily use. Additionally, our PRO masks are adjustable and come in five sizes, meaning there is one for the whole family.
